

Day 3: API Integration and Data Migration

On Day 3, the focus was on integrating external APIs and migrating product data into Sanity.

API Integration

The product data was fetched from the following API endpoint: <https://template1-neon-nu.vercel.app/api/products>

Data Migration

- Retrieved product data from the external API.
- Processed and structured the data to match Sanity's schema.
- Successfully transferred the data to Sanity, ensuring it was properly indexed and formatted for easy retrieval.

This step ensures that the marketplace has an initial set of products stored in Sanity, ready to be displayed and managed through the frontend.
